SUMMARY

I build **Socially Robust AI**: methods, benchmarks, and audits for AI robustness under social complexity. My research spans Speech AI and Computational Social Science, across three threads:

- **Disfluency-Aware AI**: *Does AI work for the person speaking to it?* (ICASSP '26, INTERSPEECH '25): Real human speech is full of disfluency — pauses, repairs, and restarts — that current systems often treat as noise. I develop benchmarks and evaluation frameworks that model these patterns as structured signal, revealing robustness failures in conversational AI systems operating on real speech.
- **Personalized AI**: *Does AI work for the person it represents?* (ICWSM '25, EMNLP Findings '25, IUI '26): AI systems respond differently to different people — shaped by signals of who we are, like gender, accent, and voice, and signals of how we express ourselves, like creativity and discourse. Understanding these signals is what it takes to build personalized AI that serves every user.
- **Governable AI**: *Does AI work for the public it answers to?* (FAccT '26): I study the infrastructures of power — governments, universities, and tech companies — that determine how AI systems are authorized, deployed, and contested. I develop audits and systems that reveal where accountability breaks down.
